group of participants who receive it is called the "control group". This is why RCTs are referred to as randomized "controlled" trials. The control can be conventional practice, a placebo, or no intervention at all. The other groups are called the "experimental" or the "treatment" groups.

CHAPTER 1 Randomized controlled trials: the basics

The randomized controlled trial (RCT) has become the most widely accepted research design for testing the efficacy of health care interventions. The purposes of this paper are to (a) introduce the essential elements of RCTs, and (b) discuss some of the special problems faced by occupational therapists in conducting and interpreting RCTs.

Randomized Controlled Trial - an overview | ScienceDirect

A randomized controlled trial (or randomized control trial; RCT) is a type of scientific (often medical)
experiment which aims to reduce bias when testing a new treatment. The people participating in the trial are
randomly allocated to either the group receiving the treatment under investigation or to a group receiving
standard treatment (or placebo treatment) as the control.
