Kapton H effective flux in a thermal energy plasma asher is the hyperthermal flux in LEO that produces the same rate of erosion of Kapton H. A comparison of flux inside-to-outside scattering chambers was made by placing 2.54 cm diameter by 0.0127 cm thick Kapton H witness samples inside and outside the chambers and comparing weight loss per area.

Results from the scattering of nearly monoenergetic ($\sqrt{E}/E \approx 2\%$) thermal energy He atoms from the LiF(001) surface are presented and discussed with particular emphasis on multiphonon interactions.

This is a rendering of a scattering solar concentrator. Light collected by a cylindrical Fresnel lens is focused within a curved glass "guide" sheet, where it is redirected into confined modes by a small mobile scattering element and transported toward heat transfer elements at the edges. A variety of novel applications for the investigation of disordered surfaces by beams of thermal energy atoms are discussed and illustrated by numerous examples. A straightforward semiclassical approach is introduced to yield a remarkably detailed insight into the lateral distributions of diffuse
